

1.9. Dust Prevention

Entrance of dust or other foreign matter into the Linear Bush will cause abnormal wear or shorten the service life. When entrance of dust or other foreign matter is predicted, it is important to select an effective sealing device or dust-control device that meets the atmospheric conditions.

For the Linear Bush, a special synthetic rubber seal that is highly resistant to wear and a felt seal (with high dust prevention effect and low seal resistance) are available as dust prevention accessories.

In addition, THK produces round bellows. Contact us for details.
