

1.2. Types and Features of the LM Stroke

●Light Load Type Model ST

Model ST is a light load type that allows a long stroke.

Shaft diameter: $\phi 6$ to $\phi 100$

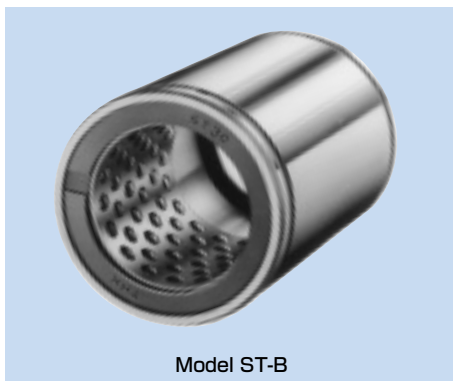

Model ST

●Medium Load Type Model ST-B

It has the same dimensions as model ST, but has a shorter stroke and achieves a rated load twice that of ST.

Shaft diameter: $\phi 8$ to $\phi 100$

Model ST-B

●Inner Ring Type Model STI

If the LM shaft cannot be hard quenched, STI allows an inner ring to be incorporated. The inner ring is available build-to-order.

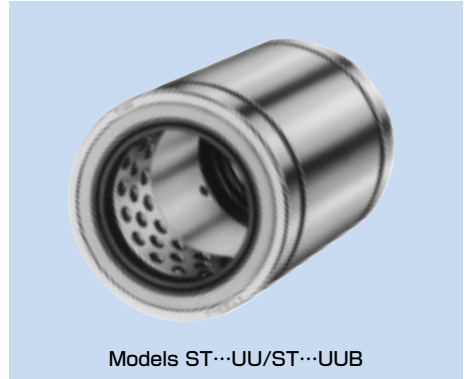

Model STI

● Seal Type Models ST...UU/ST...UUB

A special synthetic rubber seal, attached to both ends of the nut, prevents foreign matter from entering the interior of the LM Stroke and grease from leaking.

When desiring lower seal resistance, a felt seal is available for some types (models ST...DD/ST...DDB).

Models ST...UU/ST...UUB
